

FL-01 Workflow Audit - Masoom Sakina

1. Workflow Audit

#	Task Description	Classification	One-Line Rationale
1	Taking live, closed-book university exams for core ML and database courses	Just Me	Requires independent personal evaluation without external technical assistance.
2	Configuring workflow transformation nodes in KNIME for data analysis	Delegate with Review	AI can generate the specific node configurations and logic, which are then manually tested in the pipeline.
3	Designing the core architecture for the "Explainable Ensemble Learning Framework for Adaptive Financial Market Prediction" project	Collaborate with AI	The overarching research design and SHAP integration require human direction, while AI helps brainstorm component structures.
4	Writing SQL data injection scripts and designing pgAdmin schemas	Fully Automate	Rule-based data transformation scripts can handle deterministic schema alignment without manual intervention.
5	Debugging LightGBM class weights and Scikit-Learn pipeline errors	Delegate with Review	AI quickly pinpoints tracebacks and suggests code fixes to test and integrate into the main branch.
6	Defining trend-following logic and position-sizing models for crypto trading algorithms	Just Me	Financial risk parameters and core mathematical strategy require direct human oversight and accountability.
7	Deploying multi-tenant reporting dashboards using Streamlit and Plotly	Collaborate with AI	AI assists in generating boilerplate UI code while the data visualization decisions and access controls are handled manually.
8	Writing formal internship recommendation requests to university professors	Delegate with Review	AI drafts professional correspondence templates that just need personalization and a quick review before sending.

#	Task Description	Classification	One-Line Rationale
9	Synchronizing multi-frequency financial datasets for backtesting engines via DuckDB	Fully Automate	Scheduled automated pipelines handle routine data extraction and loading without daily oversight.
10	Assisting classmates with organizing Python code blocks and preprocessing arrays	Collaborate with AI	AI helps identify edge cases in data structures while guiding the overall classification pipeline logic.
11	Preparing lab assignments and formatting project conclusions	Delegate with Review	AI synthesizes raw project notes into structured markdown or PDF formats for final review.
12	Searching for and submitting early-career data analytics internship applications	Just Me	Navigating career opportunities and assessing company culture fit requires personal judgment.

2. Target Tasks & Success Definitions

Target Task 1: Scikit-Learn Data Contract & Signal Audit Pipeline

Collaborate with AI

Definition of "Done Well": A modular Python script that ingests raw structured datasets, verifies data types against a defined contract schema, flags missing values exceeding 5%, generates descriptive summary statistics, and executes with 0 silent execution errors.

Target Task 2: Synchronizing Financial Datasets via DuckDB

Fully Automate

Definition of "Done Well": An automated pipeline that successfully extracts, transforms, and loads multi-frequency financial data into a centralized DuckDB warehouse with complete schema consistency and zero unhandled timeout failures.

Target Task 3: Debugging LightGBM & Scikit-Learn Pipeline Errors

Delegate with Review

Definition of "Done Well": An AI-generated bug fix or syntax correction provided within seconds that requires minimal human editing, accurately resolves the traceback error, and compiles cleanly in the main testing branch.

3. Setup Evidence

Anthropic Academy Enrollment

Claude Project Custom Instructions
