

Three Roads: Choose Your Stack

Author: Masoom Sakina

Date: August 17, 2026

Track: AI Fluency / Machine Learning

Chosen Stack: Raw HTML/CSS hosted on GitHub Pages.

Alternatives Considered: MkDocs/Quarto (Static Site Generators) and Next.js/React.

Why this stack:

I selected raw HTML and CSS deployed via GitHub Pages because it aligns directly with my timeline, zero-cost constraint, and technical strengths as a data science student. My focus is presenting machine learning models, data validation contracts, and technical case studies—not debugging full-stack JavaScript frameworks.

Next.js was eliminated as unnecessary engineering overhead for a static portfolio. MkDocs/Quarto was considered for notebook rendering, but writing direct HTML provides faster, finer control over custom styling and design tokens without theme overrides.

Does it show my work well?

Yes. Raw HTML gives precise control over document layout, ensuring monospace code snippets, data tables, and high-resolution chart images render cleanly across devices.

Can I maintain this?

Yes. While updating shared navigation links across static pages requires manual edits, the project scope is small and manageable. It relies on zero external build dependencies, eliminating the risk of broken packages.

Backend Requirements:

Not yet. The portfolio functions strictly as a static showcase, using direct email and calendar links for communication rather than a backend database.
